Dear Hiring Team,

It is with great pleasure that I submit my candidacy for the **Software Engineer** with **Broadridge**. I bring over three years of professional experience building backend systems, automated test pipelines, and production-grade Java and Python applications, along with a strong academic foundation as a Master of Science in Computer Science graduate from Pace University, NY.

Through my experience across two engineering roles, I have built and delivered production systems that directly reflect the technical depth in software development and QA automation this position demands. As a Software Engineer at Sperse, I built GitHub Actions CI/CD pipelines for AI-agent deployments with integrated OpenTelemetry trace-based automated test suites — developing, executing, and verifying each release against expected outcomes and scoring latency, accuracy, and safety issues prior to production delivery. Alongside this, I built an agentic automated code review pipeline in Python integrating OpenAI Codex with a custom Bitbucket MCP server, developing and executing test cases to verify code quality across 25–30 PRs/week and reducing manual reviewer load across the delivery lifecycle. I also built a multi-agent CRM platform using Python, LangGraph, and FastAPI serving 10,000+ users with AGILE-driven iterative delivery, and created a FastMCP server exposing 160+ backend actions with built-in OpenTelemetry monitoring and Pydantic validation. Prior to Sperse, as a Software Engineer at Qualitest, I designed a cloud-agnostic Storage Service in Java and Spring Boot backed by PostgreSQL and Redis — then developed and executed automated test cases verifying file upload, download, and deletion workflows across S3, Google Cloud Storage, and MinIO prior to business acceptance testing. I also orchestrated Java-based long-running jobs with AWS Step Functions during platform migration, improving error recovery across 100K+ weekly executions while maintaining deployment documentation and operating manuals — directly mirroring Broadridge’s responsibilities around maintenance, migration, and deployment strategy.

My academic work and project experience demonstrate a disciplined approach to application analysis, design, and automation that aligns with the engineering discipline and collaborative culture Broadridge values. As a researcher, I built systems that required careful feasibility analysis, rigorous test-driven validation, and accurate work estimation — skills that translate directly into providing high-level technical analysis and reliable delivery commitments. My Dark Factory project further reflects this, building an orchestrator that performs dependency-aware task analysis and executes automated retry logic with verified outcomes across distributed agents.

I have always been passionate about **delivering real business value through leading technology-driven solutions** and **empowering clients to operate, innovate, and grow**, which are the foundations of Broadridge’s mission in the financial services industry. I would love to discuss my interest in this position with your team and can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com. Thank you for your time and consideration, I look forward to connecting!

Sincerely,
Osaid Khan
