Hiring Team

Relativity

Dear Hiring Team,

I am applying for the Software Engineer role at Relativity. In my current role at Sperse, I develop and operate distributed, secure full-stack cloud services for more than 10,000 users. I build React and TypeScript interfaces, FastAPI services, and observable Temporal workflows, and I own features through code review, deployment, production troubleshooting, and reliability improvements. This experience aligns directly with Relativity's need for engineers who can extend backend services and data pipelines while delivering accessible customer-facing interfaces.

I also build the engineering infrastructure surrounding these services. I implemented Redis-backed progress tracking and OpenTelemetry observability, created GitHub Actions CI/CD pipelines with automated release evaluations, and integrated OpenAI Codex with Bitbucket to automate PR triage across 25–30 pull requests each week. At Qualitest, I built Java and Spring Boot services with PostgreSQL and AWS, then orchestrated more than 100,000 weekly jobs with Step Functions and Lambda. Together, these experiences prepared me to support secure coding, containerization, incident response, and service ownership at scale.

Relativity's mission to help customers organize data, discover the truth, and act on it is compelling because trustworthy systems can turn overwhelming information into meaningful decisions. I am equally drawn to your emphasis on excellent communication, continuous learning, and exceeding customer expectations. I would bring a collaborative, product-minded approach to Relativity's AI-powered legal data solutions.

Thank you for your consideration. I would welcome the opportunity to discuss how my full-stack, distributed-systems, AI-assisted development, and operational experience can contribute to Relativity.

Sincerely,
Osaid Khan
