Dear Hiring Team,

It is with great pleasure that I submit my candidacy for the **Software Engineer, Full Stack with ImmunityBio**. I bring over three years of professional experience in full-stack web applications, RAG and AI agents, along with a strong academic foundation as a Master of Science in Computer Science graduate from Pace University, NY.

Through my experience across engineering roles, I have built and delivered production-grade backend systems that directly reflect **the architectural precision required to build high-performance AI infrastructure and microservices**. As a Software Engineer at Sperse, I architected a Next.js and Node.js AI interaction layer that translates natural-language intents into validated tool calls across 1,000+ platform endpoints — requiring rigorous API contract design, input validation, and safe execution across a distributed microservices surface. To keep these systems production-ready, I implemented a full observability stack using Langfuse and LangSmith, covering tracing, structured logging, and evaluation hooks, reducing end-to-end latency by 60% and lowering costs through targeted concurrency and routing optimizations. Prior to Sperse, as a Software Engineer at Qualitest, I contributed to the backbone infrastructure that thousands of users rely on daily. I designed and developed a cloud-agnostic Storage Service using Python and Node.js that handles REST API operations across AWS S3 and Google Cloud Storage for iOS and Android mobile applications — giving me direct experience with the kind of multi-platform, cloud-integrated systems central to this role. I also contributed to an Identity & Access Management platform built with React, Spring Boot, and AWS, ensuring secure authentication and data handling across 30+ applications. Together, these roles have prepared me to **drive the development of next-generation AI-driven web and mobile systems that empower clinicians and researchers** and drive impact within an agile engineering team.

My academic research experience has given me a rigorous foundation in model development, GPU-accelerated computing, and technical communication — skills that translate directly into **the scientific rigor and passion for innovation central to ImmunityBio's mission**. As an AI Researcher at the Pace Artificial Intelligence Lab, I conducted applied research on generative models using PyTorch on an HPC cluster, managing the full model development lifecycle — from training runs to inference optimization using vLLM and deployment via Hugging Face. Beyond building the systems myself, I led workshops on building AI Agents with LangChain and LangGraph for an audience of 50+ students. Designing and delivering those sessions required me to break down complex technical concepts clearly and accessibly — directly mirroring **the collaborative spirit and focus on technical communication needed to bridge complex AI workflows with production-grade engineering**. This experience has shaped me into an engineer who builds with rigor and communicates with clarity, both of which I would bring to **ImmunityBio and its mission to transform patient outcomes through Immunotherapy 2.0**.

I have always been passionate about **ImmunityBio's goal to reprogram the patient's immune system and build long-term immunological memory** and envision myself contributing my talent to the furthering of **conquering cancer and infectious diseases through innovative biological technologies**. I would love to discuss my interest in this position with your team and can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com. Thank you for your time and consideration, I look forward to connecting!

Sincerely,
Osaid Khan
