Dear Hiring Team,

It is with great pleasure that I submit my candidacy for the Application/Agentic AI Engineer role with NextGen Federal Systems. I bring over three years of professional experience in software engineering, RAG, AI agents, API integration, and cloud-native delivery, along with a strong academic foundation as a Master of Science in Computer Science graduate from Pace University, NY.

Through my current Software Engineer role at Sperse, I have built production agentic AI systems that align closely with RediChat's focus on specialized agents, workflow orchestration, guardrails, testing frameworks, and enterprise controls. I designed an agentic AI CRM system for AI/ML integration using LangGraph, LangChain, and FastAPI, routing tenant-scoped requests through a workflow orchestration agent to 40+ specialized AI agents and workflow specialists. I also defined reusable agent patterns and agent definitions and configurations, including objectives, behavioral instructions, input/output contracts, safety policies, and tool rules, while refactoring 500+ operations into typed dispatchers that replaced 60+ REST tools and improved tool selection accuracy by 90%. That work gives me direct preparation to translate mission workflows and operational requirements into reliable intelligent agents, tools, validation frameworks, and scalable architectures.

I have also built the evaluation and safety practices this role emphasizes. At Sperse, I created trace-driven AI testing and evaluation suites in LangSmith and Langfuse with gold-standard input/output validation, adversarial testing, regression testing, and tool-use validation across prompts and model versions before releases. I added guardrail validation with jailbreak regex, Lakera Guard, and SQLite checkpointing for multi-turn conversational testing, and shipped RAG and workflow-generation agents that produced reusable templates, workflow examples, implementation guides, and CRM code, reducing onboarding 50%. At the Pace Artificial Intelligence Lab, I built agent-evaluation pipelines using LLM judges, reward models, LangGraph, scope-boundary testing, and tool-call scoring, increasing tool-call success by 50% and giving stakeholders repeatable testing methodologies for prompt engineering and agent behavior changes.

My earlier software engineering work adds the DevSecOps and operational delivery foundation needed to deploy and sustain AI-enabled applications. At Qualitest, I built CI/CD software delivery pipelines with Git-based version control, Docker, Kubernetes, and GitHub Actions across cloud-native technologies and containerized environments. I integrated APIs, microservices, and data services by optimizing PostgreSQL queries, orchestrated workflows with AWS Step Functions, AWS Lambda, and CloudWatch across 100K+ weekly executions, and built decision-support visualizations that improved data interpretation, automation oversight, and user interaction for business and operational stakeholders. Those experiences map directly to integrating agents, orchestration workflows, APIs, and supporting services into operational environments.

NextGen's mission-focused technology work, including modern software, Digital Engineering, AI/ML technologies, and complex mission support, is a strong match for the way I build systems. Your stated focus on innovation, speed, value, collaboration, agility, and technical excellence is the environment where I can contribute meaningfully to RediChat and to mission success for defense, intelligence, and commercial customers. I would love to discuss my interest in this position with your team and can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com. Thank you for your time and consideration, I look forward to connecting!

Sincerely,
Osaid Khan
