Dear Hiring Team,

I am excited to apply for the Software Engineer – Enterprise Software role at Rivian. I bring 3+ years of software engineering experience across enterprise backend systems and AI-enabled platforms, supported by a Master of Science in Computer Science from Pace University.

At Sperse, I led concept-to-production delivery of an MCP layer that translated natural-language intents into safe, validated tool calls across 1000+ endpoints for mission-critical applications used by internal and external users. I built AI-first workflows, automation, and decision-support systems, and delivered scalable, cloud-native enterprise applications by applying distributed architecture and event-driven systems. I also implemented observability patterns aligned to Grafana (LGTM), DataDog, and Splunk style operations, improving latency by 60% and reducing LLM API cost by 50%. Earlier at Qualitest, I built and released production support systems with LangChain/RAG and PostgreSQL data pipelines, reducing ticket resolution time by 20%, and delivered cloud-native Python services over relational databases and NoSQL solutions while supporting 30+ applications with cross-functional teams.

I am especially motivated by how this role connects software engineering with supply chain and manufacturing operations. My experience building secure, high-reliability workflows, technical documentation, and cross-functional delivery maps directly to Rivian's focus on architecture, testing, security, and performance in enterprise systems.

Rivian's mission to "Keep the World Adventurous Forever" and your focus on protecting and preserving the world for future generations strongly resonate with me. I am energized by the opportunity to contribute to software that advances sustainability while improving outcomes for customers, communities, and the environment. I would love to discuss how I can contribute to the Enterprise Software team and can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com.

Sincerely,
Osaid Khan
