Dear Hiring Team,

It is with great pleasure that I submit my candidacy for the Backend Engineer (Go) position with your enterprise data platform. I bring over three years of professional experience in backend systems, distributed architectures, and production-grade engineering, along with a strong academic foundation as a Master of Science in Computer Science graduate from Pace University, NY.

Through my experience across multiple engineering roles, I have built and delivered production systems that directly reflect the technical depth and module ownership this position demands. As a Software Engineer at Sperse, I architected an end-to-end backend module that translates natural-language intents into safe, validated tool calls across 1,000+ platform endpoints — requiring rigorous architectural decisions around API contract design, input validation, and safe execution across distributed systems. I built data connectors and agent-based systems to accelerate platform adoption, owning the module end to end from architecture to production deployment with high autonomy and fast feedback loops. To maximize backend performance, I optimized prompt routing, vector serialization, and agent concurrency, reducing latency by 60% and API costs by 50% — demonstrating the kind of systems-level thinking and performance optimization focus this role demands. Prior to Sperse, as a Software Engineer at Qualitest, I designed a cloud-agnostic Storage Service using Python, PostgreSQL, and Redis that handles file operations across AWS S3, Google Cloud Storage, and MinIO via expiring signed URLs — giving me direct experience making architectural decisions and evaluating tradeoffs in multi-cloud backend design. I also developed backend workflows using AWS Step Functions to orchestrate long-running data import jobs and prevent Lambda timeouts, ensuring reliable distributed process execution. Together, these roles have prepared me to own modules end to end, make sound architectural decisions, and contribute meaningfully to your Go-focused backend engineering team from day one.

My academic research experience has given me a rigorous foundation in systems programming, distributed computing, and technical communication — skills that translate directly into the engineering discipline and collaborative culture your team values. As an AI Researcher at the Pace Artificial Intelligence Lab, I owned the full model development lifecycle from data preparation to production deployment, leveraging CUDA, PyTorch, and LORA on Pace University's HPC cluster for distributed model training. Beyond building the systems myself, I led workshops on GPU programming with CUDA and Mojo, and on building AI Agents with LangChain and LangGraph, for 50+ students. Designing and delivering those sessions required me to break down complex technical concepts clearly and accessibly — directly mirroring the knowledge-sharing and technical communication responsibilities valued in high-performing engineering teams. This experience has shaped me into an engineer who builds with rigor and communicates with clarity, both of which I would bring to your team and its mission.

I have always been passionate about building foundational backend systems that enable enterprise-scale data platforms, and I am excited by the opportunity to contribute to a revenue-positive company with a proven founding team heading toward Series B. The chance to work on data connectors, agents, vector serialization, and rules engines in Go — owning modules end to end with high autonomy — aligns perfectly with my experience and career goals. I would love to discuss my interest in this position with your team and can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com. Thank you for your time and consideration, I look forward to connecting!

Sincerely,
Osaid Khan
