Dear Hiring Team,

I am writing to apply for the **Senior Software Engineer** role with **Kyndryl**. I bring more than three years of software engineering experience building backend systems, durable workflow orchestration, and production deployment pipelines, along with a Master of Science in Computer Science from Pace University.

At Sperse, I built a **Python** and **FastAPI** backend that routes **REST-based web services** across 40+ specialized sub-agents for 10,000+ users, with secure access control, **XML/JSON** data mapping, and clear paths to **debug, troubleshoot**, and analyze complex system interactions. I also created **GitHub Actions CI/CD** pipelines for **Docker** and **Kubernetes (k8s)** deployments and used **OpenTelemetry** trace-based evals to gate releases on latency, accuracy, and safety. That work maps closely to the **high-volume business logic, maintain performance, and debug and test** responsibilities in this role.

At Qualitest, I designed a cloud-agnostic Storage Service in **Java** and **Spring Boot** for a **microservices architecture**, using **OOP** and **design patterns** to isolate storage adapters across **relational** and **NoSQL databases (PostgreSQL, Redis)**, **AWS S3, Google Cloud Storage**, and **MinIO**. I optimized **PostgreSQL** with indexes, materialized views, and window functions, then orchestrated long-running jobs with **AWS Step Functions, Lambda**, and **message queues** to improve error recovery across 100K+ weekly executions. That experience reflects the kind of scalable, robust software, cloud integration, and modernization discipline Kyndryl needs when extracting business logic from legacy systems and connecting it to cloud-based services.

Kyndryl's focus on mission-critical systems, **trust**, and inclusion resonates with how I work: I build reliable software, document failure modes, and collaborate openly across engineering teams. I would welcome the opportunity to contribute to **mainframe modernization** with the same rigor I have brought to backend reliability, observability, and production support. Thank you for your consideration, and I would value the chance to discuss how my experience can support **Kyndryl** and its mission to power human progress by modernizing mission-critical technology systems.

Sincerely,
Osaid Khan
