Dear Hiring Team,

I am applying for the **Software Engineer I** role with **TraceLink**. In my current Software Engineer role at Sperse, I investigate production agent-workflow failures through OpenTelemetry traces, application behavior, and Redis state, then build recovery and progress-tracking improvements that let customers monitor long-running executions. That combination of structured debugging, customer focus, and stability work aligns closely with Engineering Services.

My experience spans the APIs, data, cloud systems, and error paths central to this position. At Sperse, I built a secure Python/FastAPI multi-agent CRM platform serving 10,000+ users through 40+ specialized agents and 160+ backend actions. I also used Claude Code and Codex CLI to automate deployment pipelines, error monitoring, and automated testing, while validating results with trace-based evaluations before production releases. Earlier at Qualitest, I built a Java/Spring Boot storage service with PostgreSQL and Redis across AWS S3, Google Cloud Storage, and MinIO, and optimized SQL data paths for stakeholder-facing dashboards.

I bring the same ownership to reliability and continuous improvement. At Qualitest, I orchestrated long-running jobs with AWS Step Functions, reducing Lambda timeouts and improving error recovery across 100K+ weekly executions. At Sperse, I automated daily code-review triage across 25-30 pull requests per week and reduced manual review by several hours. In both roles, I used AI agents as engineering tools and reviewed their output before integration - experience directly relevant to TraceLink's expectation that engineers challenge assumptions and validate solutions for correctness and maintainability.

TraceLink's mission of agentically orchestrating the supply chain to benefit patients makes reliable engineering especially meaningful. I am drawn to the company's emphasis on integrity, collaboration, innovation, and accountable customer results, and I would welcome the opportunity to help Engineering Services turn customer-impacting issues into durable stability improvements. I can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com. Thank you for your time and consideration; I look forward to connecting.

Sincerely,
Osaid Khan
