Dear Hiring Team,

I am applying for the Software Engineer role at Vestmark because you are building the kind of **AI-native** wealth management platform I want to help ship: software that combines **innovation**, **partnership**, and **growth** with measurable operational impact. Your focus on helping wealth firms work more efficiently and serve clients better matches the kind of engineering I have been doing across **agentic systems**, workflow automation, and production backend delivery, and I already use **AI-assisted development tools**, **code generation**, and **prompt engineering** as part of that workflow.

At Sperse, I built a **multi-agent** CRM platform in **Python**, **LangGraph**, **LangChain**, and **FastAPI** for 10,000+ users, routing requests across 40+ specialized sub-agents with secure access control, shared **state management**, and production **observability**. I also shipped an **agentic code review** pipeline integrating **OpenAI Codex** with a custom Bitbucket **MCP** server, using **code generation** and **prompt engineering** to automate daily PR triage across 25-30 PRs/week. On top of that, I built a **React Flow** and **TypeScript** workflow platform backed by **Temporal** for durable, resumable execution, plus a **FastMCP** service that exposed 160+ backend actions for safe tool use and monitoring. To keep those systems production-ready, I built GitHub Actions **CI/CD** pipelines with **OpenTelemetry** trace-based evals that measure latency, accuracy, safety, non-determinism, and **inference cost awareness** across prompts and model versions before deployment. That combination maps directly to the way your team builds agentic systems, validates adaptive behavior, and ships reusable foundations.

Before that, at Qualitest, I designed a cloud-agnostic Storage Service in **Java** and **Spring Boot** with **PostgreSQL**, **Redis**, **S3**, **Google Cloud Storage**, and **MinIO** for file uploads, downloads, and deletions via expiring signed URLs. I also reduced query latency and improved scalability by optimizing **PostgreSQL** with window functions, materialized views, and indexes, then exposed the data through interactive **React** visualizations for business stakeholders. In parallel, I orchestrated long-running jobs with **AWS Step Functions**, reducing **AWS Lambda** timeouts and improving error recovery across 100K+ weekly executions. My Dark Factory project extends the same mindset into orchestration: a distributed coding-agent system that breaks large requests into dependency-aware task **DAGs** and executes them across multi-machine AI agents with retries, timeout handling, and failure isolation. I would bring that same practical focus on delivery, observability, and cloud concepts to Vestmark's mission to build AI-enabled wealth technology with purpose and impact.

I would welcome the chance to contribute to Vestmark's mission and to learn from a team that values innovation, collaboration, and growth. Thank you for your consideration, and I look forward to the opportunity to discuss how my background aligns with this role.

Sincerely,
Osaid Khan
