Dear Hiring Team,

It is with great pleasure that I submit my candidacy for the **Software Engineer (Observability)** role with **Reddit**. I bring over three years of professional experience in building highly available backend systems, observability infrastructure, and scalable data pipelines, along with a strong academic foundation as a Master of Science in Computer Science graduate from Pace University, NY.

Through my experience across engineering roles, I have built and delivered production-grade monitoring and logging solutions that reflect **the technical depth and infrastructure scale this position demands**. As a Software Engineer at Sperse, I engineered a high-availability observability layer using Langfuse and LangSmith to deliver centralized tracing, structured logs, and alerting infrastructure for 1,000+ platform endpoints. This required rigorous performance evaluations to reduce latency by 60% and ensure high-volume data consistency — skills directly applicable to managing Reddit’s observability data at scale. I also architected stateless serving pipelines and optimized application metrics routing to maximize KV-cache hit rate, reducing operational costs by 50% while accelerating the delivery of new observability features. Prior to Sperse, at Qualitest, I built a cloud-native Storage Service handling high-volume data across AWS S3 and Google Cloud Storage with high availability and fault tolerance. I also developed highly scalable backend workflows using AWS Step Functions and Lambda to handle long-running data import jobs, ensuring data consistency across distributed microservices — experiences that align with **the systems-level thinking and operational stability Reddit’s infrastructure requires**. Together, these roles have prepared me to **design, build, and deliver the centralized monitoring and alerting systems used by every engineer at Reddit**.

My academic and project experience has given me a rigorous foundation in high-performance systems and technical communication — skills that translate directly into **the “Default Open” and collaborative engineering culture Reddit values**. As an AI Researcher at Pace, I optimized distributed training on an HPC cluster using CUDA and PyTorch, conducting performance evaluations to improve model throughput for high-volume data collection. Beyond building systems, I facilitated the adoption of new observability tools and engineering practices through workshops for 50+ students. Furthermore, my “Dark Factory” project involved building a high-performance CLI orchestrator in Rust, utilizing Y-crdt for real-time synchronization across distributed machines in a Linux environment. These experiences required me to bridge the gap between complex technical infrastructure and user-facing reliability — mirroring **the leadership and tool adoption responsibilities central to this role**. I am an engineer who builds with rigor and communicates with clarity, both of which I would bring to **Reddit and its mission**.

I have always been passionate about **bringing community, belonging, and empowerment to everyone in the world** and envision myself contributing my talent to the furthering of **this mission by ensuring the reliability and health of the Reddit platform through robust observability**. I would love to discuss my interest in this position with your team and can be reached at +1 (945) 304-5781 or khanosaid726@gmail.com. Thank you for your time and consideration, I look forward to connecting!

Sincerely,
Osaid Khan
